**06-08-26 Reflection:**

In today's class, we were introduced to images, videos, computer graphics, and digital image processing. The professor explained how images refer to any form of visual data that gives information, while videos refer to a series of images continuously presented to give the illusion of movement. We came to know that computer graphics involve the creation of images while digital image processing deals with the analysis, enhancement, and manipulation of images. In addition, we got to know about geometric primitives like lines, curves, and areas as well as curve representation mathematically through calculus.

The central topic of discussion in today's class was the use of SSH for authenticating GitHub. We got to understand why SSH was better than HTTPS for developers.

**Topics discussed:**

- Differences between HTTPS and SSH
- SSH authentication – its benefits
- SSH utilities
- Git Bash
- OpenSSH
- ssh-keygen
- ssh-agent
- Creating SSH key pair
- Public key to GitHub account

**SSH Keys:**

- **Public Key**

Safe to distribute.

Uploaded on GitHub in order to authenticate the user's machine.

Used by GitHub in order to verify any authentication request.

- **Private Key**

Kept private on the user's computer.

Used to authenticate the user's identity.

Should not be distributed since it allows access to the repository.

To summarize, the lecture covered the fundamentals of computer graphics and digital image processing, with a major focus on secure Git authentication via SSH keys.
